

1. Imagine you have a list of numbers. Write a Python code to create a set that contains only the unique numbers in the list.
2. You have a set of student names who have attended a workshop. Write a Python code to add a new student to the set.
3. Suppose you have two sets of numbers. Write a Python code to create a new set that contains only the numbers that are present in both sets.
4. You have a set of words. Write a Python code to create a new set that contains only the words that start with the letter "a".
5. Imagine you have a set of customer IDs. Write a Python code to create a new set that contains only the IDs of customers who have made more than 5 purchases.
6. You have a set of employee IDs. Write a Python code to remove a specific employee from the set.
7. Imagine you have two sets of words. Write a Python code to create a new set that contains only the words that are present in the first set but not in the second set.
8. You have a set of email addresses. Write a Python code to create a new set that contains only the email addresses that end with ".edu".
9. Suppose you have a set of book titles. Write a Python code to create a new set that contains only the titles that contain the word "Python".
10. Imagine you have a list of strings representing company names. Write a Python code to create a set that contains only the unique first letters of the company names.
11. You have a set of names. Write a Python code to check if a specific name is present in the set.
12. Suppose you have two sets of numbers. Write a Python code to create a new set that contains only the numbers that are present in one set but not in both sets.
13. You have a set of words. Write a Python code to create a new set that contains only the words that end with the letter "s".
14. Imagine you have a set of customer IDs. Write a Python code to create a new set that contains only the IDs of customers who have made at least one purchase in the last week.
15. Suppose you have a list of strings representing website URLs. Write a Python code to create a set that contains only the unique domain names of the websites.
16. You have a set of book titles. Write a Python code to find the length of the longest book title in the set.
17. Imagine you have two sets of words. Write a Python code to create a new set that contains only the words that are present in both sets, and also contain the letter "a".
18. You have a set of email addresses. Write a Python code to create a new set that contains only the email addresses that end with ".com" and contain the word "sales" in the username.
19. Suppose you have a set of integers. Write a Python code to create a new set that contains only the integers that are greater than 50 and less than 100.
